Divisions of Neuropathology and Pediatric Neurology, CHU Ste-Justine, Montreal, QC,  
and Department of Pathology and Cell Biology, University of Montreal, Montreal, QC.

This 11 months old child has had intractable seizures for the past few months. MRI revealed macrogyria of the left cuneus. The border between cortex and white matter was blurred. There was no oedema around the lesion nor were there signs of increased intracranial pressure. Midline structures were not displaced. There were no other significant lesions.

Post-operative imaging, including MRI, CT failed to reveal any evidence of tumor deposits outside of the central nervous system.

Material Submitted: One representative H&E slide

Question: Diagnosis, classification and prognosis of the lesion
